Space complexity

Two main characteristics for programs

- ▶ Time complexity: \simeq CPU usage
- ▶ Space complexity: \simeq RAM usage

Space complexity: an informal definition

Definition (Space complexity)

The *space complexity* of a program (for a given input) is the number of elementary objects that this program needs to store during its execution.

This number is computed with respect to the size n of the input data.

Space complexity: a formal definition

Definition (Space complexity)

For an algorithm T and an input x , $DSPACE(T, x)$ denotes the number of cells used during the (deterministic) computation $T(x)$. We will say that $DSPACE(T) = O(f(n))$ if $DSPACE(T, x) = O(f(|x|))$ where $|x|$ is the length of x .

Space complexity: a formal definition

Definition (Space complexity)

For an algorithm T and an input x , $DSPACE(T, x)$ denotes the number of cells used during the (deterministic) computation $T(x)$. We will say that $DSPACE(T) = O(f(n))$ if $DSPACE(T, x) = O(f(|x|))$ where $|x|$ is the length of x .

- ▶ $DSPACE(T)$ is undefined whenever $T(x)$ does not halt.

Space complexity: what counts?

input space
(read only)

1	0	1	1	0	1	0	0	1
---	---	---	---	---	---	---	---	---

work space
(read/write)

0	1	0	1	1	1	1	0	1
---	---	---	---	---	---	---	---	---

output space
(write only)

1	1	0	0	1	1	1	1	0
---	---	---	---	---	---	---	---	---

Space complexity: what counts?

input space
(read only)

1	0	1	1	0	1	0	0	1
---	---	---	---	---	---	---	---	---

work space
(read/write)

0	1	0	1	1	1	1	0	1
---	---	---	---	---	---	---	---	---

output space
(write only)

1	1	0	0	1	1	1	1	0
---	---	---	---	---	---	---	---	---

- ▶ When talking about space complexity, we usually talk only about **work** space.

Space complexity: storing an arbitrary number

- ▶ How much space does it take to store n ?

Space complexity: storing an arbitrary number

- ▶ How much space does it take to store n ?
- ▶ the tape alphabet Γ is a finite set, so a finite number M of tape cells can take at most $|\Gamma|^M$ different values, we cannot store *an arbitrary number* there.

Space complexity: storing an arbitrary number

- ▶ How much space does it take to store n ?
- ▶ the tape alphabet Γ is a finite set, so a finite number M of tape cells can take at most $|\Gamma|^M$ different values, we cannot store *an arbitrary number* there.
- ▶ $O(\log(n))$ will be enough to store n .

Space complexity: an example

- ▶ Let x and y be two vectors of equal length n ,
 $\forall i : x_i \in \{0, 1\}, y_i \in \{0, 1\}$
- ▶ Calculate the product:

$$\sum_{i=1}^n x_i \times y_i$$

Space complexity: example (continued)

```
sum = 0;
for (i = 0; i < n; i++)
    p[i] = x[i] * y [i];
for (i = 0; i < n; i++)
    sum += p[i];
return sum;
```

Space complexity: example (continued)

```
sum = 0;
for (i = 0; i < n; i++)
    p[i] = x[i] * y [i];
for (i = 0; i < n; i++)
    sum += p[i];
return sum;
```

If considering only work space:

$$T(\text{findMin}, n) = \text{size}(p) + \text{size}(i) + \text{size}(\text{sum}) = n + 2 \times \ln(n) = O(n)$$

Space complexity: example (continued)

```
sum = 0
for (i = 0; i < n; i++)
    sum += x[i] * y [i];
return sum;
```

Space complexity: example (continued)

```
sum = 0
for (i = 0; i < n; i++)
    sum += x[i] * y [i];
return sum;
```

$$T(\text{findMin}, n) = \text{size}(i) + \text{size}(\text{sum}) = 2 \times \ln(n) = O(\ln(n))$$

Logarithmic space complexity

The class L is defined as:

$$L = DSPACE(\log(n)).$$

L is the (complexity) class of decision problems that can be solved using a deterministic Turing Machine and a logarithmic amount of space.

Log-space reduction

Definition (Log-space reduction)

Problem A is log-space reducible to problem B , if A can be reduced to B using a log-space Turing machine M .

Polynomial space complexity

The class $PSPACE$ is defined as:

$$PSPACE = \bigcup_{k \in \mathbb{N}} DSPACE(n^k).$$

$PSPACE$ is the (complexity) class of decision problems that can be solved using a deterministic Turing Machine and a polynomial amount of space.

PSPACE-complete problems

- ▶ The “hardest” problems in $PSPACE$ constitute the $PSPACE$ -complete class.
- ▶ A problem $A \in PSPACE$ is $PSPACE$ -complete if all problems in $PSPACE$ are polynomial-time reducible to A .
- ▶ This class includes problems from automata theory, computational linguistics (parsing), and game theory.

PSPACE-complete: Canadian traveller problem

- ▶ A generalization of the shortest path problem...

PSPACE-complete: Canadian traveller problem

- ▶ A generalization of the shortest path problem...
- ▶ ...to graphs that are *partially observable*.
- ▶ The structure of the graph is gradually revealed while exploring.

Relation between *DTIME* and *DSPACE*

- ▶ What can you say about relation between *DTIME* and *DSPACE*?

Relation between *DTIME* and *DSPACE*

- ▶ What can you say about relation between *DTIME* and *DSPACE*?
- ▶ It is impossible to use more cells than steps in the computation.
- ▶ So $DTIME(f(n)) \subseteq DSPACE(f(n))$.

Questions

- ▶ Can you name a problem, which is in $PSPACE$ but not necessarily in P ?

Questions

- ▶ Can you name a problem, which is in $PSPACE$ but not necessarily in P ?
- ▶ Can you prove that $NP \subseteq PSPACE$?
