

CA326 Standard Project

Project Description

You are required to implement an interactive Connect Four application (see http://en.wikipedia.org/wiki/Connect_Four). This application should provide an interactive interface to allow the user to play Connect Four against your system. Your project will therefore involve an AI element in trying to develop an appropriate strategy for your system to play at a sufficiently high level against all users.

You may choose any development environment and platform. However, your project must be demonstrated in a School of Computing lab, either on a standard lab machine or your own machine.
