Business Process Modelling

Historical View of BP Modelling

- Work Process Flow (early to mid 1900s)
  - Frank Gilbreth & his ‘Flow Process Charts’ (= flowcharts)
  - First structured method for documenting process flow
- Work Flow (mid-1970s)
  - Motivation was disenchantment with the above
  - Acted as a genesis for BP Modelling
- Business Process Modelling (2000s)
  - Trend towards new manufacturing paradigm - Virtual Enterprise
  - VE=distributed & parallel BP execution from each VE entity
  - Need effective process modelling with strict model analysis

Business Process Modelling- The “What?”

- Business process modelling (BPM) is the activity of representing processes of an enterprise, so that the current process may be analyzed and improved.
- Typically performed by business analysts & managers seeking to improve process efficiency and quality.
- The process improvements identified by BPM may or may not require IT involvement, although that is a common driver behind modelling a business process.
Business Process Modelling - The "Why?"

- Business process modelling (BPM) helps companies in the following ways:
  - To become more process-oriented
  - To optimise business processes through Process Change Mgmt: long-term planning, execution & control of processes
  - To document and manage processes on an ongoing basis
  - To simulate processes using, i.e., Monte Carlo simulation & Discrete Event Simulation

Business Process Modelling Notation

- Why BPM Notation (BPMN)?
  - A notation that can be understood by all business users,
  - i.e., business analysts (creating initial drafts of processes)
  - & technical developers (implementing technology performing these processes).
- Where does BPMN fit in with tools so far (WF/PNs)?
  - swimlanes/WF not flexible for VE/whole organisations so BPMN encapsulates WF models through use of swimlane diagrams
  - process is sound = for each state reachable from the initial state, a firing seq exists leading system to the final state. In a process model with formal execution semantics, these types of properties can be defined precisely & verified automatically by tools.
  - BPM Diagrams can be translated to PNs for analysis & verification.
  - Can be mapped to UML.

BPMN – Yet Another Bloody Standard??

- Business Process Management Initiative (www.bpmi.org)
  - established to promote & develop use of Business Process Management (BPM) through the use of standards for process design, deployment, execution, maintenance, and optimization of processes.
- BPMI has developed three standards to facilitate BPM
  - BPMN, as a standard for modelling business processes,
  - Business Process Modelling Language (BPML), as the standard business execution language, &
BPMN: Business Process Diagrams

- BPMN specifies one Business Process Diagram (BPD).
- Diagram designed to do two things well:
  - easy to use and understand, used to quickly & easily model business processes, & easily understandable by non-tech users (usually mgmt).
  - offers expressiveness to model very complex business processes & can be naturally mapped to business execution languages.
- Steps:
  - model the events that occur to start a process, processes that get performed, & end results of the process flow.
  - business decisions and branching of flows is modelled using gateways.
  - process can contain sub-processes, shown by another BPD connected via a hyperlink to a process symbol.
    - If a process is not decomposed by sub-processes, considered a task - the lowest-level process.
    - A '+' mark in the process symbol denotes that the process is decomposed; if it doesn’t have a '+' mark, it is a task.

BPMN: Business Process Diagrams

Pools & Lanes

- Pools
  - a basic BPMN element setting the BP boundaries.
  - it contains at most one business process.
  - i.e. two processes must be modelled in two different pools.
  - must create a pool first of all in a tool like Signavio.
- Lanes
  - a sub-partition within a pool, is used to categorize BP activities.
  - usually, a denotes an org role (developer, analyst and manager).
  - however, may also be used for e.g first phase, second phase.
  - a lane is just a "activity-classifying mechanism"
BPM Notation: Flow Objects & Connecting Objects

- **Events**
  - Represented with a circle
  - Denotes something that happens (rather than Activities which are something that is done)
  - Icons within the circle denote type of event (e.g. envelope for message, clock for time)
  - Events are also classified as
    - Catching (i.e., catch an incoming message to Start process)
    - Throwing (i.e., throw a message at End of process)
  - Types: Start, Intermediate, End

- **Activities**

- **Gateways**

- **Connecting Objects**

**BPM Notation: Flow Objects: Events**

- **Start event**:
  - Triggers process
  - Indicated by a single narrow border
  - Can only be Catch, so shown with open (outline) icon

- **End event**:
  - Represents result of a process
  - Indicated by a single thick/bold border
  - Can only Throw, so shown with a solid icon

- **Intermediate event**:
  - Something happening between start & end events
  - Indicated by a tramline border
  - Can Throw or Catch (using solid/open icons as appropriate) - e.g., task could flow to an event throwing a message to another pool & a subsequent event waits to catch the response before continuing.
**BPM Notation: Connecting Objects**

- **Sequence Flow:**
  - represented by a solid line with a solid arrowhead
  - used to show order (sequence) that activities will be performed in a Process.

- **Message Flow:**
  - represented by a dashed line with an open arrowhead
  - used to show flow of messages btw 2 separate Process Participants (business entities/business roles) that send & receive them.

  - in BPMN, 2 separate Pools in Diagram will represent two Participants.

- **Association:**
  - represented by a dotted line with a line arrowhead
  - used to associate data, text, & other Artifacts with flow objects.
  - used to show inputs & outputs of activities.

---

**BPM Notation: Example 1**

- Example: A process with a normal flow with the Business Process Modeling Notation.

---

**BPM Notation: Swimlanes**

- As seen, swimlanes are a mechanism to organize activities into separate visual categories to illustrate different functional capabilities or responsibilities. BPMN supports swimlanes with two main constructs.

  - the two types of BPD swimlane objects are:
    - **Pool:**
      - represents a participant in a process.
      - also acts as a graphical container for partitioning a set of activities from other Pools usually in the context of B2B situations.
    - **Lane:**
      - a sub-partition within a Pool extending entire length of the Pool, either vertically or horizontally.
      - used to organize & categorize activities.
Pools are used when diagram involves 2 separate business entities or participants & are physically separated in the diagram.

The activities within separate Pools are considered self-contained Processes.

=> Sequence Flow may not cross the boundary of a Pool. Message Flow is defined as being the mechanism to show the communication between two participants, & thus, must connect between two Pools (or the objects within the Pools).

BPM Notation: Artifacts

- BPMN designed to allow modellers and modelling tools flexibility in extending basic notation & in providing ability to add additional context appropriate to a specific modelling situation.
- Any number of Artifacts can be added to a diagram as appropriate for the context of the business processes being modelled.
- Current version of BPMN specification pre-defines only 3 types of BPD Artifacts.
BPMN Handouts

BPM Notation: Artifacts cont’d

• BPMN specification pre-defines only 3 types of BPD Artifacts:
  • Data Objects:
    • mechanism to show how data is required or produced by activities.
    • connected to activities through Associations.
  • Group:
    • represented by a rounded corner rectangle drawn with a dashed line.
    • can be used for documentation or analysis purposes, but does not affect the Sequence Flow.
    • used to organize & categorize activities.
  • Annotations:
    • represented by an open rectangle containing annotation text.
    • mechanism for a modeller to provide additional text info for reader of a BPMN Diagram.

BPM Notation: Example 2

• A Segment of a Process with Data Objects, Groups, and Annotations.

BPM Software

• Every org’n has their very own distinct bps which differentiate them from their competitors.
• Some have predefined processes, some have processes which are defined by the employees themselves.
  • (Eg Customer Support: Imagine what would happen if cs rep had his/her way of managing a customer. Need a proper bp to handle cs)
• Every org’n needs a practical step by step BPM approach which works together with BPM solutions.
• Lately, with advanced web-based solutions, bps & wfs can be managed through BPMgmt solutions.
BPMN Software cont’d

- These BPMGmt solutions can be used to easily create applications to automate processes such as:
  - Change management
  - Quality control
  - Customer service
  - Claims management
  - Complaint management
  - Procurement
- There are many BPM / WF solutions out there. Will look at some open source solutions to evaluate before looking at the proprietary/commercial ones.

BPMN Software cont’d:
- ProcessMaker: open source, BPMgmt & WF s/w designed for SMEs.
- User friendly solution to manage WF effectively and efficiently.
- Business users & process experts without programming experience can design & run WFs, automate processes across systems ie HR, finance & operations.
- Can easily create WF maps, design custom forms, extract data from external data sources to optimize WF mgmt & bus. ops.
- One advantage is online library with process templates to download & edit to reduce learning curve. Process templates include:
  - Credit card application
  - Expense report process

BPMN Software cont’d:
- Bonita Open Solution is an intuitive & powerful open source BPMgmt solution applicable to simple & complex processes.
- The Bonita Studio which meets BPMN is part of the Bonita Open Solution including Bonita Execution Engine & Bonita User Experience.
- One strong point about Bonita Open Solution is its great user experience which is quite similar to standard email Inbox to easily and quickly organize your work, follow up on tasks / cases and collaborate with colleagues.
BPMN Software cont’d:

- Unlike ProcessMaker, CuteFlow is a web-based open source document circulation & workflow system.
- Users able to define "documents" for sending step by step to every station/user in a list.
- CuteFlow helps to automate document circulation process within office internal environment.
- All operations like starting a WF, tracking, WF-definition or status observation done within a comfortable and easy to use web interface.
- Some key features of CuteFlow include:
  - Integration of workflow documents in e-mail message
  - Unlimited amount of sender, fields, slots, receiver...
  - Workflows can attach data and files
  - Flexible user management with substitutes
  - Wide user base

BPMN Software cont’d: Commercial

- Figure 1 (from Gartner) evaluated on:
  - Implementation of a Specific Process-Based Application
  - Support for a Continuous Process Improvement Mentality
  - Redesign for a Process-Based SOA
  - Business Transformation Initiatives

BPMN Software cont’d: Lombardi

More BPMN Examples

Example 3: Buying a Book

(a) Some conversation between 2 pools.

(b) A more complex version of (a) involving more interplay in one pool.

Example 4: Hospital Admission

Note the way that registration details are handled. This could also be done using a data object representing the patient’s details.

Note the exclusive gateway where sequence diverges. This can also be represented with an X, e.g.:
Example 5: Applying for Leave

Example 6: The Bank Robber

Example 7: Buying an MP3 at An Argos Store
Example 8: Buying an MP3 at An Argos Store

Note the new intermediate event representing an error or exception.

Note the intermediate timer event.

Note the parallel gateway representing all sequences happening.

Example 9: An Ebay Auction

“Draw a BPMN diagram for an online auction purchase process. Your diagram does not need to include the “make-offer” components, but should include components for “buy-it-now” and “bid”. Identify the different categories of BPMN elements in your diagram.”

Example 10: Client Getting Quotes (More Complex Stuff)

Note the parallel splitting & complex merging gateways representing some sequences happening and some not.

Note the “terminate” end event representing “Stop everything”.
