

## Mathematical Prerequisites: Answers

1.
  - a. True
  - b. False
  - c. True
  - d. True
  - e. True
  - f. True
  - g. False
  - h. True
  - i. False
2.
  - a.  $\{1,3,5,7\}$
  - b.  $\emptyset$
  - c.  $\emptyset$
  - d.  $\{\{8\},\{7,8\},\{8,9\},\{7,8,9\}\}$
  - e.  $\{\emptyset\}$
  - f.  $\{\langle 1,1,1\rangle,\langle 1,1,2\rangle,\langle 1,1,3\rangle,\langle 1,2,1\rangle,\langle 1,2,2\rangle,\langle 1,2,3\rangle\}$
  - g.  $\emptyset$
  - h.  $\{\langle \emptyset,1\rangle,\langle \emptyset,2\rangle,\langle \{1\},1\rangle,\langle \{1\},2\rangle,\langle \{2\},1\rangle,\langle \{2\},2\rangle,\langle \{1,2\},1\rangle,\langle \{1,2\},2\rangle\}$
3.
  - a. This will be the case if  $g(f(A)) = C$
  - b. This will be the case if  $a \neq b$  implies  $g(f(a)) \neq g(f(b))$
  - c. This will be the case if both of the above conditions are satisfied.

Note: It is possible for  $h$  to be surjective without  $f$  being surjective, and it is also possible for  $h$  to be injective without  $g$  being injective.

For example: let  $A=\{a\}$ ,  $B=\{b,b'\}$ ,  $C=\{c\}$  and  $f(a) = b$ ,  $g(b) = c$ ,  $g(b') = c$

4.
  - a. Because the three sets are countable, we can list their elements:  
  
First set:  $a_{00} a_{01} a_{02} \dots$   
Second set:  $a_{10} a_{11} a_{12} \dots$   
Third set:  $a_{20} a_{21} a_{22} \dots$   
  
We can list all the elements of the union of these three sets (with possible repetitions) as follows:  
  
 $a_{00} a_{10} a_{20} a_{01} a_{11} a_{21} a_{02} a_{12} a_{22} \dots$   
  
Therefore, this set is countable. Since the union of the three sets is a subset of this, it must also be countable.
  - b. The finite subsets of  $\mathbb{N}$  may be arranged as follows:  
  
First row: all the singleton subsets of  $\mathbb{N}$ , i.e.,  $\{1\}, \{2\}, \{3\}, \dots$ ,  
Second row: all 2-element subsets of  $\mathbb{N}$ , i.e.,  $\{1,2\}, \{1,3\}, \{2,3\}, \{1,4\}, \{2,4\}, \{3,4\},$

$\{1,5\}, \dots,$

Third row: all 3-element subsets of  $N$ , i.e.,  $\{1,2,3\}, \{1,2,4\}, \{1,3,4\}, \{2,3,4\}, \{1,2,5\}, \{1,3,5\}, \{1,4,5\}, \{2,3,5\}, \{2,4,5\}, \{3,4,5\}$ , etc.  
and so on, enumerating all subsets of  $N$  by set size.

We may then enumerate the complete set using a dovetailing approach by visiting the sets in the corresponding array of sets in a diagonal fashion.

5.

a.  $f(n) = 2n+1$

b.  $f(n) = (n+1)/2$ , if  $n$  is odd  
 $= -n/2$ , if  $n$  is even

c. We define an ordering on triples as follows:

$$\langle x_1, y_1, z_1 \rangle < \langle x_2, y_2, z_2 \rangle, \text{ if } x_1 + y_1 + z_1 < x_2 + y_2 + z_2$$

$$\langle x_1, y_1, z_1 \rangle < \langle x_2, y_2, z_2 \rangle, \text{ if } x_1 + y_1 + z_1 = x_2 + y_2 + z_2 \text{ and } x_1 < x_2$$

$$\langle x_1, y_1, z_1 \rangle < \langle x_2, y_2, z_2 \rangle, \text{ if } x_1 + y_1 + z_1 = x_2 + y_2 + z_2 \text{ and } x_1 = x_2 \text{ and } y_1 < y_2$$

This gives us the following ordering:

$$\langle 0,0,0 \rangle < \langle 0,0,1 \rangle < \langle 0,1,0 \rangle < \langle 1,0,0 \rangle < \langle 0,0,2 \rangle < \langle 0,1,1 \rangle < \langle 0,2,0 \rangle < \langle 1,0,1 \rangle < \langle 1,1,0 \rangle < \langle 2,0,0 \rangle \dots$$

We can now define a bijection  $f$  between  $N$  and this set as follows:

$$f(0) = (0,0,0), f(1) = (0,0,1), f(2) = (0,1,0), f(3) = (1,0,0), \dots$$

6.

a.  $\emptyset \in C$  (by 1)

Therefore  $\{\emptyset, \emptyset\} = \{\emptyset\} \in C$  (by 2)

Therefore  $\{\emptyset, \{\emptyset\}\} \in C$  (by 2)

b.  $C$  does not contain any infinite sets because all its elements must be constructed by a finite number of applications of rules 1, 2 and 3. However,  $C$  does contain an infinite number of sets.

c.  $C$  is countable. We can list the elements of  $C$  as follows:

Apply rule 1, and then repeatedly apply rules 2 and 3 for all pairs of elements already listed.

7. Base Case ( $n=1$ )

$$\text{RHS} = 1 \times 2 \times 3 \times 4/4$$

$$= 1 \times 2 \times 3$$

$$= \text{LHS}$$

Inductive Hypothesis: Assume true for  $n$ :

$$1 \times 2 \times 3 + 2 \times 3 \times 4 + \dots + n(n+1)(n+2) = n(n+1)(n+2)(n+3)/4$$

Inductive Case: Show that it is true for  $n+1$ :

$$\begin{aligned} \text{LHS} &= 1 \times 2 \times 3 + 2 \times 3 \times 4 + \dots + n(n+1)(n+2) + (n+1)(n+2)(n+3) \\ &= n(n+1)(n+2)(n+3)/4 + (n+1)(n+2)(n+3) \text{ (by inductive hypothesis)} \\ &= n(n+1)(n+2)(n+3)/4 + 4(n+1)(n+2)(n+3)/4 \\ &= (n+1)(n+2)(n+3)(n+4)/4 \\ &= \text{RHS} \end{aligned}$$

8. Base Case ( $n=0$ )

$$n^3 + 2n = 0 \text{ (which is divisible by 3)}$$

Inductive Hypothesis: Assume true for  $n$ :

$$n^3 + 2n \text{ is divisible by 3}$$

Inductive Case: Show that it is true for  $n+1$ :

$$\begin{aligned} &(n+1)^3 + 2(n+1) \\ &= n^3 + 3n^2 + 3n + 1 + 2n + 2 \\ &= (n^3 + 2n) + 3n^2 + 3n + 3 \\ &= (n^3 + 2n) + 3(n^2 + n + 1) \end{aligned}$$

Each of these terms is obviously divisible by 3 (the first by the inductive hypothesis)

Therefore the predicate is true for all  $n$

9. The sets  $\{\dots, -3, -2, -1, 0\}$  and  $\{0, 1, 2, 3, \dots\}$  are both countably infinite. Their intersection  $\{0\}$  is finite.

The sets  $\mathbb{Z}$  (integers) and  $\mathbb{Z}^+$  (positive integers) are both countably infinite. Their intersection ( $\mathbb{Z}^+$ ) is countably infinite.

The sets of real numbers in the intervals  $[-1, 0]$  and  $[0, 1]$  are both uncountable. Their intersection  $\{0\}$  is finite.

The sets  $\mathbb{R}^+ \cup \mathbb{N}$  (positive reals and naturals), and  $\mathbb{R}^- \cup \mathbb{N}$  (negative reals and naturals) are both uncountable. Their intersection ( $\mathbb{N}$ ) is countably infinite.

The sets  $\mathbb{R}$  (reals) and  $\mathbb{R}^+$  (positive reals) are both uncountable. Their intersection ( $\mathbb{R}^+$ ) is uncountable.

10. Assume we have an uncountable set  $S$  and a countable set  $T$ .

$S \cap T$  is countable, since it is a subset of  $T$ .

If  $S - T$  were countable, then  $(S - T) \cup (S \cap T) = S$  would be also.
